

Automating FaaS-based Federated Learning

Matt Baughman

ParslFest

October 20, 2023

A few main ideas...

The Application: ML/FL

The Challenges: Workload
Balancing, Tuning
Hyperparameters, Robustness

What is Federated Learning?

- ❖ Problems with traditional ML
 - Data locality
 - Resource distribution
 - Privacy concerns
- ❖ Distributed data sources
 - Training at those sources
 - No raw data is communicated or shared
- ❖ Configurable aggregation
- ❖ Assists in security
- ❖ Use of distributed resources

Why serverless is the answer...

- ❖ Portability and interoperability
 - Functions when and where they are needed
- ❖ Modularity
 - Register functions and replace function IDs as needed
- ❖ Fire-and-forget
 - We do not need constant contact between resources
 - Excellent for weak networks
- ❖ Needs to be easier than home-spun solution
 - Very simple FL is trivially easy
 - `np.mean(list_of_weights)`
 - Widespread adoption requires undercutting ease at every stage
- ❖ We have put together **FLoX–Federated Learning on funcX**

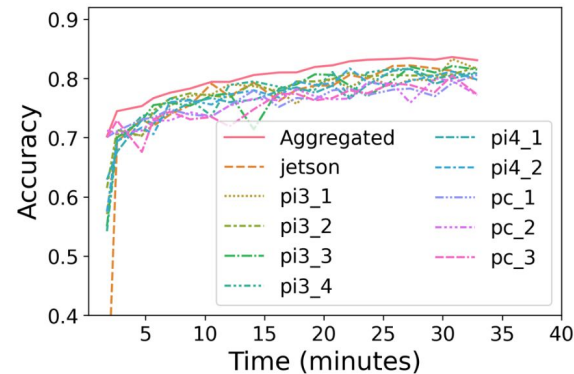

*final logo design pending

Workload balancing

- ❖ Serverless enables computing on many different devices
 - Many different devices are imbalance
- ❖ Remove compute bottlenecks by altering endpoint workloads
- ❖ Demonstrated effective FL while varying both samples and epochs

(a) Balancing samples

(b) Balancing epochs

Autotuning: an ongoing effort

- ❖ Users shouldn't have to configure experiments either!
- ❖ Understanding workload balance and aggregation
 - Frequency of aggregation
 - Every epoch to once per experiment
 - Comparing workload balance methods
 - Balancing on epochs, samples, or both
 - Epochs seems like the parameter to sacrifice
 - Much more testing needed
- ❖ Currently testing on sensitivity to dropped endpoints

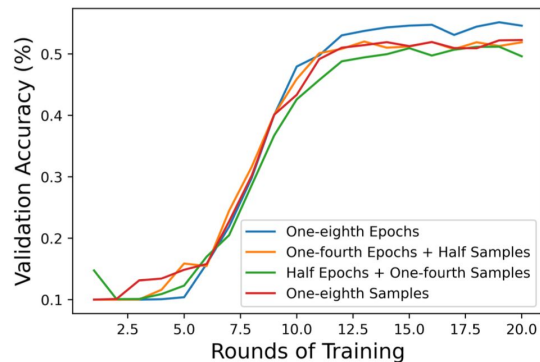

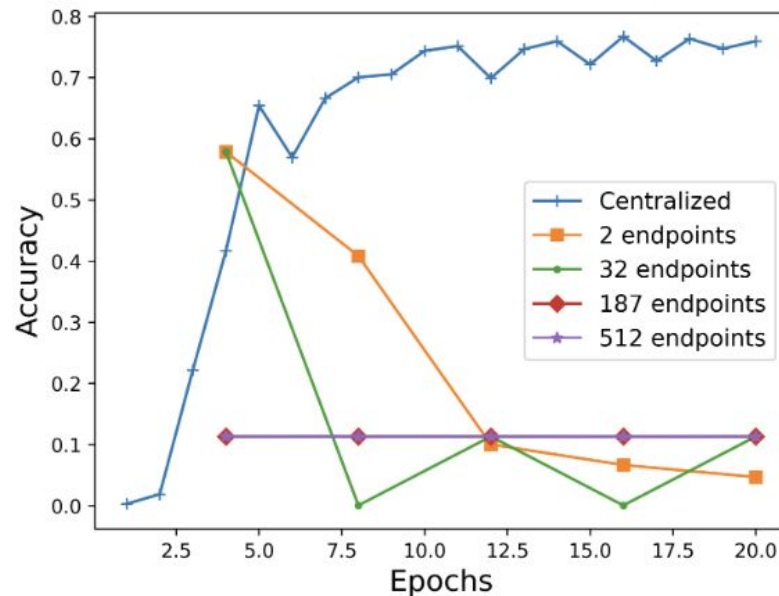

Figure 2: Comparison of balancing techniques to perform FL between two high powered endpoints and two additional endpoints with one-eighth the capabilities.

Autotuning: a practical use-case

- ❖ FL data is more prone to being sparse/ non-IID
 - More difficult to learn
- ❖ FL models are likely to be smaller and less able to learn complex features
- ❖ Result: extreme forgetting when learning sparse features across multiple endpoints
 - Anything learned is “averaged” away
- ❖ How to address this...
 - Must be automatic
 - See “ease of use” challenge
 - Algorithms
 - Tournament based pretraining
 - Advanced aggregation

Let's generalize...

```

def control_stuff(time_sensitive_data):
    return(doing_stuff)

def definitely_recursion(recursive_data):
    return(definitely_recursion(recursive_data))

def pass_masters(questionable_stuff):
    return(pass if random((0,100))>50 else do_industry())

def do_stuff(big_data):
    return(stuff_done)

def solve_collatz(start_value):
    if start_value>0 and start_value <= np.inf:
        return(1)
    else:
        return(1)

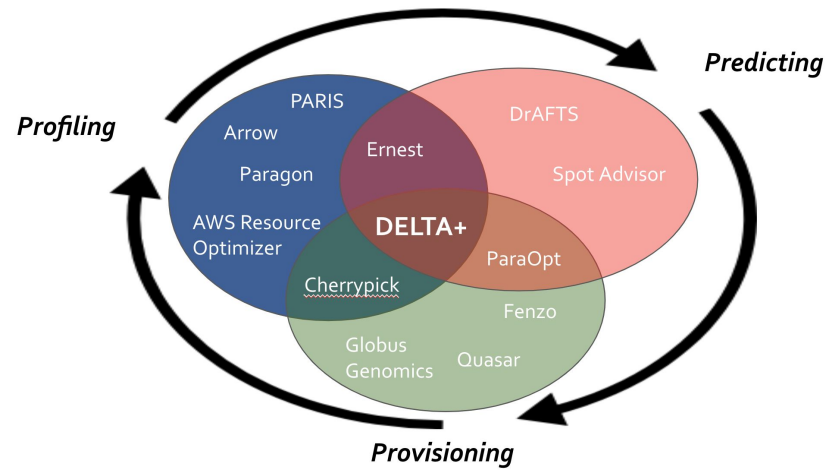

def parallel_stuff(1):
    return((1)*np.inf)

def p_equals_np(math):
    return(True)
    
```

("modern" distributed system)

- ❖ DELTA+
 - Automate placement of funcX/GC tasks across available endpoints
 - Work began ~2020
 - Minor improvements since
 - Cloud provisioning
 - ML-based placement
 - Probabilistic scheduling
 - Complex cost usage
- ❖ Potential applications in FL?

The Big Idea – Automate Distributed ML/FL

- ❖ Data all over the place
 - More data all the time
- ❖ Many endpoints
- ❖ Hybrid structure
 - Distributed ML on HPC
 - Ad-hoc clustering for hierarchical aggregation
 - Global workload coordination/consolidation
- ❖ “Compute where the data lives”
- ❖ Perhaps more cost effective to move the data?
 - “Train or transfer?”
 - Train *and* transfer!

Future Work

- ❖ Hybrid/hierarchical FL
 - FL principles as a distributed ML paradigm
 - Distributed ML on a resource, FL on multiple resources
- ❖ Decentralized FL
 - Endpoints initiate training rounds – event-driven FL?
- ❖ DELTA-Learn
 - Big resource management issues
 - Profiling endpoints/workloads - embeddings for resource characteristics?
 - Placing tasks - graph ML?
 - Consolidated multi-modal ML – using different data from different endpoints?
 - Extraction questions, data management, knowledge discovery, etc
 - FL for FL – self-adaptive ML/FL system (learn by doing)

Questions?
